Low Risk = 2 fluoride varnishes per year.
• No cavities.
• No fillings.
• Teeth cleaned twice daily by parent(s).
• Sugary foods and drinks are limited.
• Regular visits to a dental professional.

High Risk = 4 fluoride varnishes per year
• Cavities and/or fillings.
• New cavities starting (white spots).
• Teeth not cleaned by parent(s).
• Sugary foods and drink between meals (i.e. a bottle or a sippy cup containing anything other than water between meals or feedings).
• Family does not visit or have access to a dental professional regularly.
• Parent/caregivers have cavities.
• Child has special health care needs.

If your child is ‘high risk,’ by changing only one or two behaviours you can reduce the risk of new decay!
Congratulations if your child is already in the ‘low risk’ category!

What is Fluoride?
• It is found naturally in some well water, and can be added to water systems to help prevent tooth decay.
• It helps to harden tooth enamel (the outside surface of teeth) and make teeth stronger.
• FV can even help to prevent small cavities from getting bigger.
• It only takes a few seconds to apply FV with a small brush.
• Your dental professional will recommend twice daily brushing with fluoride toothpaste in addition to FV.
